Experiment - 3

Aim :- To create HTML page using external cascading style sheets (CSS).

Theory :-

External CSS :-
An external style sheet is used to define the style for many HTML pages.
With an external style sheet, you can change the look of an entire web site, by changing one file.

Each page must include a reference to the external style sheet file inside the <link> element. The <link> element goes inside the <head> section.
For example :-

```
<head>
    <link rel = "stylesheet" type = "text/css"
        href = "mystyle.css">
</head>
```

An external style sheet can be written in any text editor. The file should not contain any HTML tags. The style sheet file must be saved with a .css extension.
